OMAHA HEALTH SYSTEMS DEVELOPMENT

Hi Daniel,

Following up on the emails below information how Omaha and care plans working methods.

Sample care plans serve as a tool
Care professionals can use the sample care plans as a tool during assessment and care delivery. These care plans allow you to create a tailored plan for an individual client. This means making deliberate choices about what is or is not applicable. It is important to note that these are sample care plans, not standard care plans.
The sample care plans combine the Omaha System framework with substantive national guidelines and expertise from the field. In addition to the domain-category-action-target structure, the specifications list the relevant components of these national guidelines. This enables care professionals to use the Omaha System while also quickly and easily accessing current standards, and allows them to cross-reference their individual care plan against the sample plan and up-to-date knowledge.

What exactly are sample care plans? Here are the six key characteristics:
1. A tool for creating a tailored plan for an individual client.
2. An overview of all possible focus areas and interventions.
3. A combination of the Omaha System framework with substantive national guidelines and expertise from the field.
4. Developed in collaboration with nurses.
5. Sample care plans, not standard care plans.
6. Several Electronic Client Record (Dutch: ECD) vendors have integrated these sample plans into their systems. Making it even easier!

Working method
The sample care plans cover all possible focus areas and interventions—so there are many of them. It is explicitly not intended for all focus areas and interventions to be adopted into an individual care plan. For each component, the care professional assesses what is and is not appropriate for the specific client within their context. They can also adjust the specifications to tailor the plan.
The Omaha System ensures a common language, and the use of sample care plans further reinforces this. However, since no two patients are alike, it remains essential for nurses and care workers to carefully observe the client and continue to think critically about the care provided. The sample care plans serve as a support tool rather than a directive.

Electronic Care Record vendors receive the sample care plans and can integrate them into the care planning system as selectable options.

Blessings,
Gert Jan

Good morning Daniel,

Please find the example formulations for PDCA (HIV/AIDS) attached.

Blessings,
Gert Jan

Hi Daniel,

Following up on the email below, here is a standard care plan based on the Omaha System—in this case, for CVA/stroke. Such examples are provided to vendors of Electronic Patient Record (EPR) software in the Netherlands for integration as standard features within their systems. This simplifies the process of creating a PDCA cycle or care plan.

Blessings,
Gert Jan
